

ABSTRACT

A transceiver, which is capable of being used even in a severe situation such as situations in salvage operations and the like
5 in which the transceiver is often submerged, comprises: a PTT switch for transmitting an audio signal upon depression of the switch; a sound input/output portion for inputting and outputting a sound; a main body portion for transmission and reception of a radio signal; wherein all the above components except the main body portion are
10 formed into independent units; wherein means for transmitting and receiving a signal between the independent units and the main body portion is provided.
